Biometric Access Solutions

The Gallagher and IDEMIA biometric integration offers a fast and secure way to ensure users are identified correctly. Users 'are' their credential - with Command Centre you can save time, increase security, and improve business process.

Integration benefits:

- Save expense with biometric enrollment and template management conducted directly through Gallagher Command Centre, eliminating the need for operators to purchase, train in and use two separate systems
- Save time on installation and configuration. Much of IDEMIA reader installation and configuration tasks have been automated and simplified
- Flexible and scalable. Reader options and adjustable licensing allow both large and small sites to make use of the biometric reader technology. Combinations of IDEMIA biometric and Gallagher card readers can easily be deployed.

Integration features:

- Accurate and effective. IDEMIA biometric recognition algorithms are rated highly by NIST (National Institute of Standards and Technology) - an independent institute of standards.
- Duress biometrics. For finger and Wave templates, if a duress biometric credential is presented at a reader, access is granted but an alarm is raised in Gallagher Command Centre
- Privacy options. The enrolled biometric template is encoded to a MIFARE® smartcard in one pass, never stored in permanent PC memory. This gives the enrolled user full control of their biometric template, providing peace of mind regarding privacy issues.

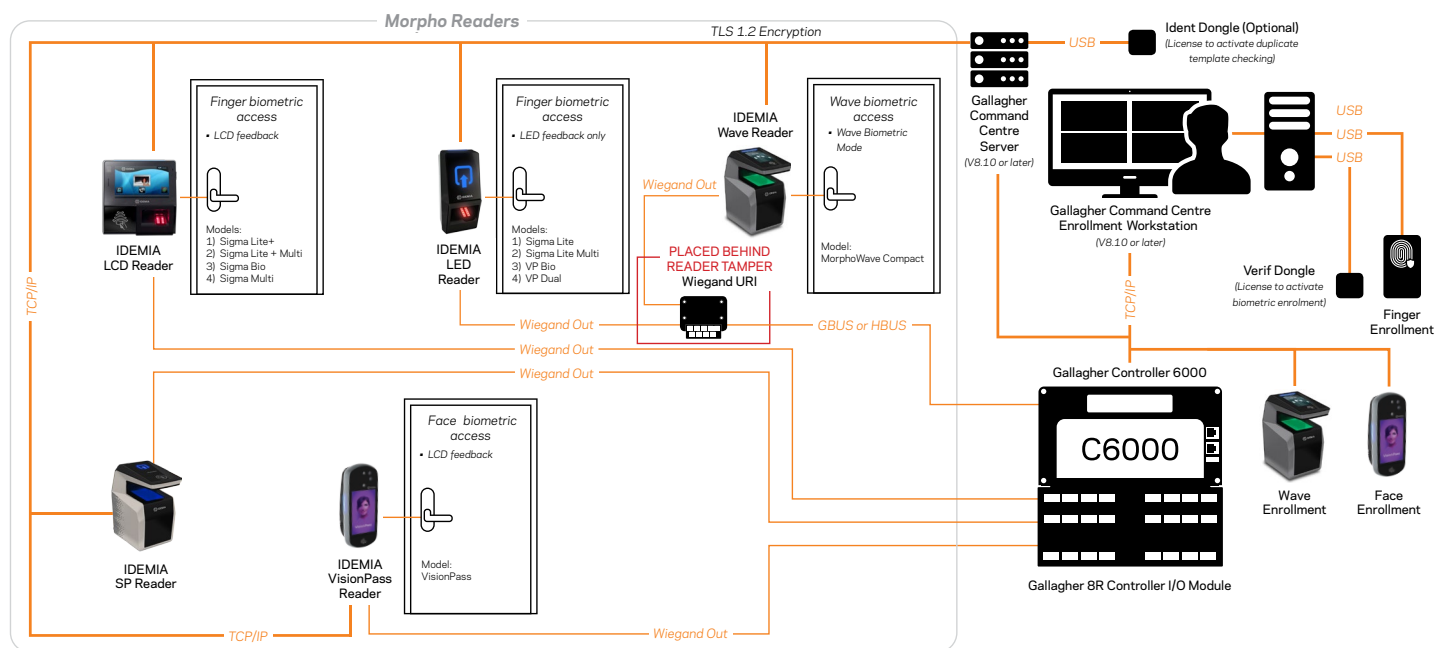

How the solution works

The high level integration between Gallagher and IDEMIA covers the two primary aspects of biometric authentication, identification and verification:

Identification - Biometric only

Identification is suited for customers wanting cardless access to areas of their site. Identification compares a person's finger, Wave or face biometric template to a database of stored templates, typically stored on the reader, and identifies the person from this database.

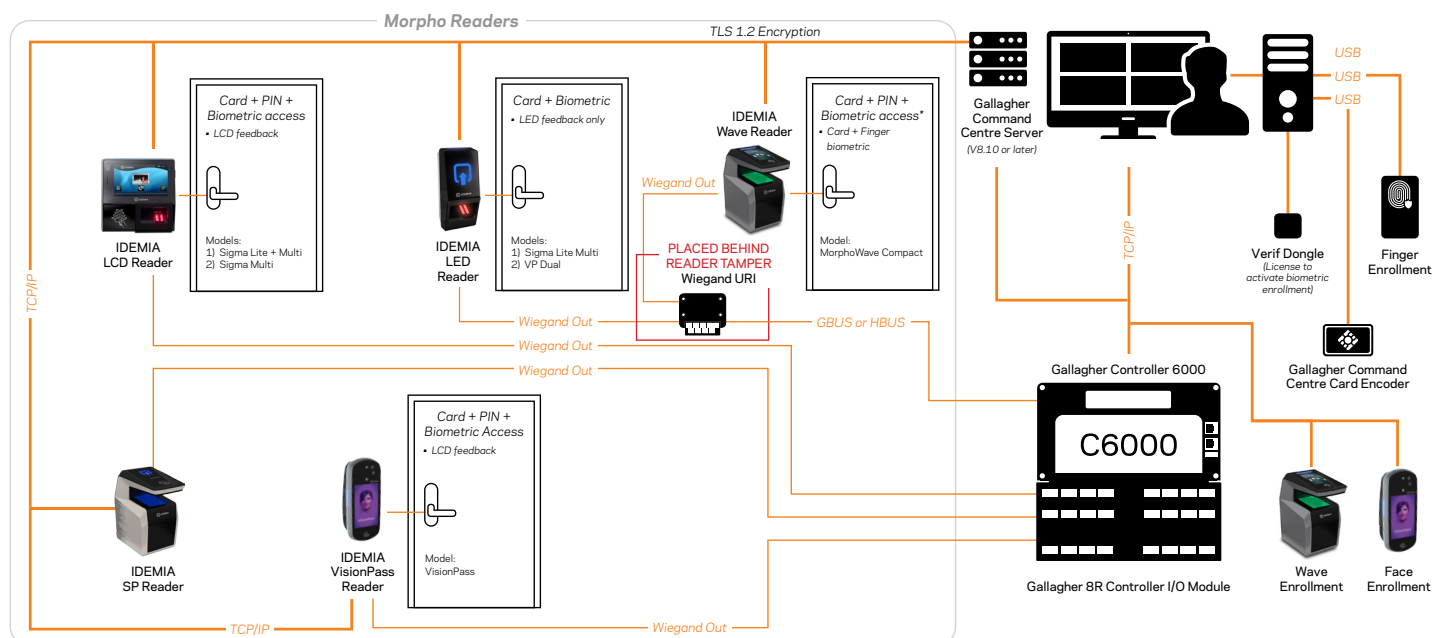

This is also commonly referred to as a '1 to many' or '1 to n' comparison. An employee presents their finger or face at the reader, which checks the reader database for a match. If the reader finds a match, it sends through the employee's ID to the Gallagher Controller for an access control decision.

Verification - Card + Biometric + PIN

Verification is suited for customers wanting the high security of multi-factor authentication options (card + biometric + PIN).

Verification compares a person's biometric against a single biometric template, stored on the card. This is commonly referred to as a '1 to 1' comparison. Employees present their card to the reader, and then present their biometric template. The reader checks if the presented biometric matches the template stored on the card. If the reader finds a match, it sends through the employee's ID to the Gallagher Controller for an access control decision.

Secure template management

Encryption dongle requirements

Authentication Mode	CCFT Server	CC Enrol Workstation	Reader license DB
1:n Identification	Verif Dongle*	Verif Dongle	Sized to suit user count through door
1:n Identification (with duplicate template check)	Ident Dongle	Verif Dongle	Sized to suit user count through door
1:1 Verification	Verif Dongle*	Verif Dongle	N/A (template stored on card)

* From Command Centre v7.80 or later:
1. Maci license is not required on the server
2. Verif dongle is not required on the server unless it is used to enroll biometric templates
